

The dfltxbtocconfig package

Lars Madsen*

March 4, 2010

Contents of this package

This package is not really meant for public use. It is used in the preparation of *Introduktion til L^AT_EX my* (Danish) L^AT_EX user manual.

The package takes care of configuring the two main table of contents used in the book. People should use the code for inspiration (be aware, it is quite messy) for their own ToC configurations.

One interesting feature used in this version of the package: In the latest memoir (as of February 2010) there are some added hooks in the ToC macros that aren't documented in the memoir user manual. In this package we use these hooks to measure the widest section numbers and such in the ToC, save it to the main aux file, and then on the next run, use it to auto adjust the width of the section number boxes.

A new release of the *memoir experimental* package will explain more about how this works.
